

# Technical preview of the data set details feature in IBM® Cloud Private for Data

**Note: This is a technology preview and is not yet supported for use in production environments.**

After discovering assets, you can review information like quality score, data classes, assigned terms. To better understand the discovery results, drill down into the data set details. Each data set contains the following tabs:

- Governance - contains information about terms.
- Columns - contains properties of each column in a data set, like a data class, or assigned terms.
- Data quality - contains information about data quality violations.
- Data classes - contains information about discovered data classes.
- Data types - contains information about discovered data types.
- Rules - contains information about data and quality rules which use data in this data set.
- Primary keys - contains information about discovered primary keys.
- Foreign keys - contains information about discovered foreign keys.

The data set details are read-only.

### **Procedure:**

To access data set details, complete the following steps:

1. Go to **Organize > Discover assets > Discovery results**.
2. In the URL, add the feature flag `featureTechPreview=on`, as in:  
`https://host:port/ibm/iis/igcui/connections/autoDiscoveryResults?featureTechPreview=on`
3. Look for the discovery which you want to review, and open its details page.
4. Review the list of discovered assets, and click **Review discovery results** icon for one of them.
5. In the **Actions** column, click the **Data set details** icon.
6. Review the details. To display information for one specific column, click the column name in the column table.
