

The last line of defense in a ransomware attack

In today's environment, cyber incidents and ransomware attacks are on the rise. The rapid shift to digital has only increased exposure and the likelihood of an attack. Any failure to recover your critical data after a malicious cyberattack can and will compromise your business.

ENTER – Air Gap Solutions as a potential ransomware defense to your organization. Air Gap solutions have proven ineffective, so you should scratch them from your list of cyber defense controls UNLESS air gaps are a component in a broader set of security technologies that help defend against cyberattacks.

Please join Eduardo Ciliendo and Diego Bessone from IBM on June 9th at 12:00 PM ET for a webinar featuring guest Merritt Maxim, VP & Research Director from Forrester. In this session, Merritt will review key cybersecurity challenges facing organizations today and why solutions like air gaps are not an effective cyber defense on their own. This will be followed by a discussion from Eduardo and Diego on how the IBM Z Cyber Vault solution differentiates from the air gap alternatives in the market by not only providing you with data copies but by actively monitoring for data corruption so that your organization detects a cyber-attack faster and is ready to respond in a heartbeat.
